

Achieving PCI Compliance and Protecting Customer Data:

Creating a holistic security program strategy for the future

A large restaurant chain collecting customer data at more than 200 locations across the U.S. and Canada

EXPERIENCED A BREACH OF ITS POINT-OF-SALE (POS) SYSTEMS.

Though a secure connection was used to send customer information to a main data center, several of the POS systems were compromised with malware,

RESULTING IN STOLEN INFORMATION.

Because PCI standards require compliance at the highest level after a breach, the company needed to become compliant quickly and cost-effectively, in addition to addressing its overall security program.

With this service, Optiv:

Remediated affected point-of-sale systems and create a cost-effective solution.

Identified and address additional security gaps.

Created a plan for the future based on a layered security approach.

Optiv's security assessment services provided this client with many benefits, including:

Secured data: safeguarded customer payment card information across the network.

Compliance: met complex and strict PCI compliance requirements post-breach.

Cost-savings: saved time and money through a holistic and efficient new security program.

New security plan: implemented a manageable security program for the future.

Ongoing partnership: created a partnership with Optiv for compliance and technology consultation.
