Weave Security Into Every Step of Development

Historically, most developers haven’t been security professionals. This means today’s developer does not often make application security their priority, which can lead to DevOps efficiency issues, steep compliance fines and costly breaches. But especially in light of recent supply chain attacks, a secure software development lifecycle (SDLC) is important for developers now more than ever. By “moving security left” to include it from the initial stages of application development, organizations can simultaneously increase efficiency, lower costs and reduce risks.

Optiv Solutions

Optiv’s Secure SDLC Hardening Model meets you where you are to understand your organizational challenges, as well as your existing capabilities, resources and business profile. Building on your current level of maturity, we’ll provide future-state guidance to help you set your goals and then attain them with realistic, business-aligned capabilities.

Remember: a secure SDLC program isn’t something you can buy; it’s a capability you evolve over time. While some organizations will aspire to the highest level of maturity, others won’t have the desire or resources to do so, and that’s perfectly normal. Some organizations may even operate on multiple levels of maturity. Part of the journey is setting appropriate goals and understanding the resources needed to reach them. Together, these will define your organization’s ideal maturity level.

Why Clients Choose Optiv

Highly technical, dedicated, boutique-style application security consulting team

50+ consultants, over 600 years’ combined programming and AppSec experience

We provide AppSec services to seven of the Fortune 10

Optiv tests more than 1,000 applications every year and have exploited hundreds of high-risk vulnerabilities before they become incidents
